IPCC Inventory Software Version 2.17 – Revision 1

Release note

This version of the IPCC Inventory Software fixed bugs and errors identified since Version 2.17 was released on 1 March 2016 (see the table below).

Sector	Location in Software	Detail of bugs and errors
IPPU	Worksheet: 2B1	Column G - CO ₂ recovered from urea production. The multiplication factor "44/12" is incorrect and has been replaced by "44/60" (p.3.12 of Volume 3 of the 2006 IPCC Guidelines)
Tools – Key category analysis	Tools	The cumulative total column does not reach a value of 1 in the approaches the program generates, instead it stays at values around 0.9-0.95. It seems that this issue started after introducing some optimizations to the calculation process, which in special circumstances could affect precision. This bug was fixed.
