1 INTRODUCTION TO NATIONAL GHG INVENTORIES

No refinement.

Users are expected to go to Mapping Tables in Annex 1, before reading this chapter. This is required to correctly understand both the refinements made and how the elements in this chapter relate to the corresponding chapter in the 2006 IPCC Guidelines.

1.1 CONCEPTS

Inventories rely on a few key concepts for which there is a common understanding. This helps ensure that inventories are comparable between countries, do not contain double counting or omissions, and that the time series reflect actual changes in emissions.

The *2019 Refinement* provides supplementary *good practice* guidance for estimating and reporting anthropogenic greenhouse gas (GHG) emissions and removals resulting from land use, land-use change and forestry (LULUCF) activities in Chapter 2 of Volume 4 intended to reduce the impacts of natural disturbances on trends capturing the impacts of human activities, building on chapter 2.3.5 of the *2013 Revised Supplementary Methods and Good Practice Guidance Arising from the Kyoto Protocol (KP Supplement)*.

Treatment of CO₂, CH₄ and N₂O emissions from combustion of biomass or biomass-based products

The overall IPCC approach to greenhouse gas emissions from combustion of biomass or biomass-based products (e.g., ethanol) at the national level allows for complete coverage of emissions and sinks, and involves all IPCC sectors, including in particular, Energy, Agriculture, Forestry and Other Land-Use (AFOLU), and Waste.

Carbon dioxide (CO₂) emissions from the combustion of biomass or biomass-based products are captured within the CO₂ emissions in the AFOLU sector through the estimated changes in carbon stocks from biomass harvest, even in cases where the emissions physically take place in other sectors (e.g., energy). This approach to estimate and report all CO₂ emissions from biomass or biomass-based products in the AFOLU was introduced in the first IPCC guidelines for national greenhouse gas emissions (IPCC 1995), reflecting close linkages with data on biomass harvesting, and for the pragmatic reason to avoid double counting.

In AFOLU, carbon dioxide (CO₂) emissions from biomass or biomass-based products used for energy purposes are calculated as an implicit component of carbon stock changes for forests and other wood producing land categories, as part of carbon stock changes in the HWP pool, or when a country chooses to use more advanced (higher tier) methodologies for carbon stock changes in above ground biomass from annual crops. The CO₂ emissions from biomass or biomass-based products used for energy purposes are not included in the sectoral total emissions in either the Energy or Waste sectors. This guidance is to avoid the possibility of double counting these emissions in two or more inventory sectors¹.

In the Energy sector, CO₂, CH₄ and N₂O emissions from combustion of biomass or biomass-based products for energy are estimated, but the CO₂ emissions are recorded as an information item that is not included in the sectoral total emissions for the Energy sector. This provides a complete picture of a country's energy system and avoids double counting of these emissions with those reported in the AFOLU sector. The CH₄ and N₂O emissions from the combustion of biomass or biomass-based products for energy are reported and included in the sectoral total emissions in Energy sector, as these are not covered by the estimation methods in the AFOLU sector.

Carbon dioxide emissions from waste incineration or burning under the Waste sector can derive from both a fossil and biomass materials. When waste is incinerated for energy, the CO₂, CH₄ and N₂O emissions from the biogenic part of waste are treated in the same way as emissions from other combustion of biomass or biomass-based products for energy (i.e., CO₂ emissions are recorded as an information item in the Energy sector). When waste is burned without energy recovery, CH₄ and N₂O emissions from the biogenic part of waste are estimated and included in the Waste sector, whereas the corresponding CO₂ emissions are not reported to avoid double counting with CO₂ emissions reported in the AFOLU sector.

¹ For annual crops, the IPCC Guidelines assume that biomass carbon stock lost through harvest and mortality equal biomass carbon stock gained through growth in that same year and so annual crops involve no net CO₂ emissions or removals from biomass carbon stock changes when using Tier 1 methods in the AFOLU Sector (see Section 1.2, Chapter 1, Volume 1 of the *2006 IPCC Guidelines*).

Final Draft

1.2 ESTIMATION METHODS

No refinement.

1.3 STRUCTURE OF THE GUIDELINES

No refinement regarding the structure of the *2006 IPCC Guidelines*. Regarding the structure of the *2019 Refinement*, see the Overview Chapter.

1.4 INVENTORY QUALITY

No refinement.

1.4A NATIONAL GHG INVENTORY ARRANGEMENTS

This section provides guidance on establishing GHG inventory arrangements that support the sustained updating and maintenance of high quality and continuously improving national GHG inventories.

It is considered *good practice* that countries maintain and where possible improve the quality (transparency, accuracy, completeness, comparability and consistency) of national GHG inventories. It is generally accepted that GHG inventories are useful to users if they are updated on a regular basis. There should be improvement over time to provide increasingly useful information on national GHG trends (including influencing factors) and transparent reporting. Establishing sustainable national GHG inventory arrangements will help to continuously improve and regularly update national GHG inventories.

The details of this section should not be considered prescriptive. They provide suggested approaches and examples of national GHG inventory arrangements demonstrated to be useful when developing sustainable GHG inventory systems that will improve quality², timeliness, and use of resources.

National GHG inventory systems should be developed in cooperation or integration with other environmental and sustainability statistical data collection services and reporting activities (see Box 1.0a).

² Transparency, accuracy, completeness, consistency and comparability.

Box 1.0A (New)**LINKAGES OF GHG INVENTORY ACTIVITIES WITH OTHER DATA COLLECTION AND REPORTING**

The following linkages can be beneficial and could be managed as a wider programme under GHG inventory arrangements.

National Statistical Systems provide a wide range of data that can be relevant for the GHG inventory compilation. These statistical systems collect data on a regular basis and establish standards for data quality. GHG inventory compilation is a specialised national data collection activity that requires the collection of additional data that are not typically in national statistics (e.g. emission factors). GHG inventories should use national statistics where possible. Countries may integrate their national GHG inventory arrangements, to varying degrees, with their national statistical systems.

Subnational GHG inventory compilation (e.g. cities, states, provinces, territories) can bring benefit to and gain from engagement with more structured and coordinated national GHG inventory arrangements. This benefit can result from interest in and contribution to combined efforts to gather/collate/use geographically resolved data on large industrial installations and regulated sites (including waste disposal and recycling/treatment sites), and diffuse traffic and transport, agriculture and forestry data. Use of common guidelines, approaches and assumptions and pooled resources/expertise between national and subnational estimation activities will also help to improve the efficiency and credibility of GHG estimates and decision-making processes associated with them.

National GHG and air pollutant inventories can be compiled in tandem. This cooperation or integration can improve quality across inventories, as a large proportion of the activity data (energy, agriculture, transport statistics) are the same for both. It may also improve linkages (through consistent use of data) between climate mitigation and air pollution reporting (e.g. to the UNFCCC and UNECE) and tracking the impact of air pollution and GHG measures to help decision makers understand the co-benefits and potential conflicts. Countries that apply this integrated or cooperative approach may pool resources and management systems for both GHGs and air pollutant inventories and operate more efficiently.

Other environmental and sustainability data gathering processes are undertaken in many countries. These processes involve the collection, reporting of environmental, and sustainability data, including GHG emissions and removals, (e.g., in support of indicators for the UN's Sustainable Development Goals and national statistical environmental economic accounts). These initiatives often have a direct links to GHG inventory compilation activities in either using data from the GHG inventory or providing inputs to its datasets.

1.4.1 Institutional Arrangements

This section introduces the concept of institutional arrangements. There is a wide diversity in approaches used by countries to monitor, report and respond to review of its GHG estimates on a regular basis. A sustainable process for compilation and continuous improvement is an important aspect of institutional arrangements. Recognising this, this section presents some common concepts and provides some examples of approaches that could be used when setting up or strengthening sustainable GHG inventory arrangements.

Institutional arrangements include the interactions between organisations that are involved with the GHG inventory inputs, compilation processes, and outputs. This could include environment, energy, transport, agricultural, and statistical ministries and/or agencies, academic/research institutions, private organisations and career experts and consultants.

Countries may also consider the need for new or modified laws or directives establishing requirements for data collection, archiving, reporting, and quality management to formalize institutional arrangements for national GHG inventory compilation in the context of existing national statistical data collection systems.

Final Draft

1.4.1.1 GHG INVENTORY OBJECTIVES

A useful concept to help define GHG inventory activities and outputs are a country's GHG inventory objectives and other decision-making needs for the GHG data. The identification of objectives will help define the GHG inventory's data and expertise needs, roles and responsibilities, scope (e.g. sectors, gases, geographies, time-series duration), and timeframes (e.g. schedule and updating frequency) for the inventory compilation, reporting, and review processes. Identifying and assessing objectives also helps the institutions involved in the compilation understand how/if objectives interact/conflict/mesh with IPCC *good practice*. An illustrative example of a simplified format that could be used to characterise objectives is presented in Table 1.1. Such a summary table could complement more detailed descriptions when presenting GHG inventory arrangements. An illustrative example summary constructed around the United Kingdom's GHG inventory objectives is presented in Table 1.2.

TABLE 1.1(NEW) A SUGGESTED STRUCTURE FOR CAPTURING AND SHARING INFORMATION ON THE OBJECTIVES OF THE NATIONAL GHG INVENTORY							
Objective ¹	Gases ²	Sectors & categories ³	Geographical resolution	Temporal resolution of estimates ⁴	Time series span ⁵	Reporting frequency ⁶	Reporting formats ⁷

1. List the objectives that the national GHG inventory supports.
2. Add gases included e.g. CO₂, CH₄, N₂O, fluorinated GHGs, other gases such as precursor pollutants.
3. Add sectors included Energy, IPPU, AFOLU, Waste, other sectors.
4. The temporal resolution is usually annual (e.g. 2010, 2011, 2012). Some GHG inventories have different durations spanning several years or sub-yearly (e.g. monthly data).
5. Indicate the start and end date of the time series.
6. How frequently is the data updated?
7. Highlight any specific reporting formats (e.g. table structures, schemas, variables needed for specific reporting).

Final Draft

187

1.4.1.2 STRUCTURING OF INSTITUTIONAL ARRANGEMENTS

Clarifying the structure of institutional arrangements can help formalise and communicate the functional roles of organisations in the national inventory compilation process. An illustrative structure provides an overview of the roles and responsibilities for the functioning system whether this is part of a larger statistical data gathering operation or an isolated and dedicated GHG inventory activity. An informative structure diagram could also include organisation names. An illustrative example structure with optional components is presented in Figure 1.0.

An overview of the roles and responsibilities within institutional arrangements is elaborated in section 1.4.1.3.

Figure 1.0 (New) Illustrative example of GHG inventory institutional arrangements structuring

Final Draft

1.4.1.3 ROLES AND RESPONSIBILITIES

There are many actors and stakeholders involved with and/or interested in GHG inventory inputs, processes, and outputs. Common actors and stakeholder types are presented in Table 1.3. Understanding the interests, contributions and involvement of these actors and stakeholders can help to establish a long-term well functional national GHG inventory system.

TABLE 1.3 (NEW) LIST OF COMMON ACTORS AND STAKEHOLDER TYPES WITH THEIR GENERAL ROLES AND CAPABILITIES NEEDED TO FUNCTION		
Actor and Stakeholder Type	Typical Roles	Necessary Capabilities
Single National Entity (SNE) /National Focal Point (NFP) (see 1.4.1.4)	<p>Acquisition and allocation of resources.</p> <p>Development of long-term strategy for GHG inventory support to national decision makers, climate action and reporting.</p> <p>Arranging contracts and agreements with collaborating entities that contribute data, research studies, estimate emissions or provide expert reviews, etc.</p> <p>Responsible for submission of GHG inventory.</p>	<p>Technical and administrative expertise, as well as formal government authority.</p> <p>Understanding of reporting requirements and IPCC <i>good practice</i> concepts.</p> <p>Capacity to coordinate and lead the process.</p> <p>Authority to engage other government departments and non-government organisations.</p>
A group or management structure that contributes to steering the GHG inventory development and who is interested in its outputs and key messages on trends in GHGs (e.g. Steering committee, see 1.4.1.5)	<p>Provide input to the planning, coordination, management and technical facilitation of inputs and outputs in the process, advisors to the National Focal Point.</p> <p>Advice on choice of methods with regard to data availability and decision-making needs.</p>	<p>Sectoral, dataset and/or government policy involvement, knowledge, and authority over data collection, research and national strategies.</p> <p>Involved with policy and decision making and negotiations (e.g. on target setting and mitigation implementation) that uses national GHG inventory data</p>
Inventory manager/coordinator (see 1.4.1.6)	<p>Management of contracts and delivery of workplans.</p> <p>Coordination with all actors and stakeholders.</p> <p>Management of experts.</p> <p>Management of data supply and data supply agreements.</p> <p>Identification of resources necessary to improve data flows.</p> <p>Coordination of reviews and responses to independent review/analysis and tracking of recommendations.</p> <p>Technical reporting of GHG inventory data and formal submission of reports.</p>	<p>Project management & team management.</p> <p>QA/QC (see section 1.7.3).</p> <p>Technical knowledge of the reporting requirements, review processes and IPCC methodologies.</p> <p>Technical awareness of tools, processes, and IT systems for gathering and reviewing data.</p>
<p>Compilation (sector) experts and researchers (see 1.4.1.7)</p> <ul style="list-style-type: none"> • Energy • IPPU • AFOLU • Waste 	<p>Overall development of methods, data sources, data gathering, compilation and document management.</p> <p>Identify and propose ways to resolve cross cutting issues.</p> <p>Undertake research, data collection, calculations, drafting, quality control, archiving, and documentation.</p> <p>Coordinate with other sector experts.</p> <p>Specialist in a sector, category or group of categories.</p>	<p>Technical knowledge of the reporting requirements and IPCC methodologies.</p> <p>Technical skills to carry out the work required for the GHG inventory calculation (data analysis, QA/QC, calculations, documentation).</p> <p>Familiarity with national statistics.</p> <p>Specific national sectoral or sub-sectoral knowledge of practices and technologies employed, data sources, trade associations, networks, policies and key assumptions.</p>

Data providers (see 1.4.1.8)	Timely delivery of input data in appropriate format. Management of data acquisition, processing and reporting systems, QA/QC requirements. Communication with SNE, the Inventory Agency and sector experts, as needed.	Technical skills/knowledge of, legal authority to improve and enhance data collection. Understanding of the datasets provided.
Other contributors and users	General interest in the work with provision of expertise, independent review, research or use of the data for other purposes.	Any
Policy advisor	GHG inventory data users that inform policies and feed into climate action analysis.	Any

Each actor/stakeholder contributing to the national GHG inventory may need some form of terms of reference (ToR) to facilitate their engagement. This ToR can help to specify functional roles and responsibilities (e.g. inventory compilation, expert input, tool development and use, and/or data collection and storage) and the schedule for conducting this work. Existing terms of reference for duties such as environmental data gathering or industrial reporting may also be revised to address GHG inventory responsibilities.

The process of engaging actors and stakeholders is likely to be different in different countries. However, the development and maintenance of a list of actors and stakeholders, their roles, responsibilities and interests are quite common. Table 1.4 provides suggested metadata for listing actors and stakeholders involved in the GHG inventory process.

TABLE 1.4 (NEW) SUGGESTED METADATA FOR TRACKING GHG INVENTORY STAKEHOLDERS						
1.Name	2.Organisation	3.Contact	4.Mandate	5.Engagement Activities	6.Sector	7.Role

1. **Name:** stakeholders name.

2. **Organisation:** organisation affiliation.

3. **Contact:** contact details.

4. **Mandate:** mandate/terms of reference to contribute to the GHG inventory (if any).

5. **Engagement activities** (Activities that the stakeholder has been regularly involved with e.g. training, workshops, regular meetings attended, data provision etc.).

6. **Sector:** sectors/categories involved with (any particular sector or category involvement).

7. **Role:** type of involvement (e.g. as a data provider, data user, compilation expert, coordinators, data gathering, QA/QC, review, steering committee meetings, training, sectoral workshops, compilation and reporting activities, consultations, and reviews.

1.4.1.4 THE SINGLE NATIONAL ENTITY

The term “single national entity” (SNE) is often used to refer to the lead organisation with the responsibility for reporting official national GHG estimates. It is often aligned with the national focal point or international point of contact on climate reporting. The role of SNE is usually taken on by a government ministry with mandate to manage the country’s GHG inventory reporting and response to climate change or may be with a national statistical or environmental agency. A key role within the SNE is that of overseeing the GHG inventory activities. A designated focal point coordinates the activities needed to ensure that outputs are prepared of sufficient quality to meet the country’s commitments. The role of SNE is sometimes delegated by a government ministry, via mandates/terms of reference, to a climate change, environmental, or statistical agency with the technical capacity to prepare national reports. This can be the Inventory Agency with a mandate to report the GHG inventory data to the ministry or on behalf of the ministry internationally.

Final Draft

1.4.1.5 NATIONAL GHG INVENTORY TECHNICAL STEERING COMMITTEE OR WORKING GROUP

Countries may find it useful to establish a working group or committee of interested actors and stakeholders to participate in national processes for approving GHG inventory developments and estimates.

This group or committee can consist of actors and stakeholders representing users of (e.g. policy makers) and data providers to the national GHG inventory (e.g. research agencies, national statistical organisations, environment agencies, academic institutions, industrial trade associations, and consultancies). It can provide a forum for the SNE to coordinate and communicate on GHG inventory activities and to secure data provision and independent analysis.

This group of stakeholders can be also convened in support of prioritisation and implementation of inventory improvements.

1.4.1.6 INVENTORY MANAGER/COORDINATOR

Types of institutions that could serve as inventory manager/coordinator include:

- **A government ministry.** Inventory management and coordination can be implemented by a government ministry that also serves as the SNE, in which case it should have the appropriate coordination and technical capacity.
- **A national institution/agency.** Inventory management and coordination is delegated to a competent institution (e.g. statistical, meteorological, or environmental). Such an institution is typically focused on providing technical support and analysis to government officials for decision making and reporting. It will often have expertise on certain sectors and access to some of the datasets needed for the compilation and will then outsource other data gathering and compilation for other sectors (e.g. Forestry and Other Land Use to forest agencies or institutions).
- **A private company, university or other non-government organisation.** The inventory management and coordination are contractually delegated to an organisation outside of government, such as a university, research institute, or a consultancy/private company. This organisation is selected for its technical competency and capacity to coordinate the activities and expertise for the compilation and reporting of the inventory. Contracts are typically set-up with well-defined deliverables and quality objectives³ and commitments to engage the organisation preferably over a suitable period (e.g. 3 to 5 years) to promote the sustained development and maintenance of the GHG inventory. Provisions should be in place for the full transfer of data, documents, calculation and reporting tools and knowledge of the national GHG inventory from the contracted organisation to the SNE or new contracting organisation at the end of the contract period.

Whether the inventory is managed within the national government or by external organisations, provisions should be in place for the transfer of data, documents, calculation and reporting tools and knowledge of the national GHG inventory to a new inventory manager/coordinator, including consideration of adequate training investment. These provisions will ensure national retention of institutional knowledge and capability to ensure that the inventory can continue to be delivered and achieve quality standards in the future.

1.4.1.7 COMPILATION EXPERTS

A national GHG inventory system needs a committed team of inventory compilation experts. These experts understand the requirements for inventory quality (as defined in Chapter 1.4 of the *2006 IPCC Guidelines*), IPCC methods, national emission/removal related sectoral processes/practices, and national datasets. It is advantageous for experts to have a good understanding of international reporting and review processes, which can be developed through participation in international or regional peer review activities.

Roles and responsibilities for core compilation functions of the GHG inventory team are also outlined in a comprehensive templates prepared by the US EPA in the Greenhouse Gas Inventory Toolkit (EPA 2016). These are not the only examples, but they provide a useful starting point for specifying terms of reference.

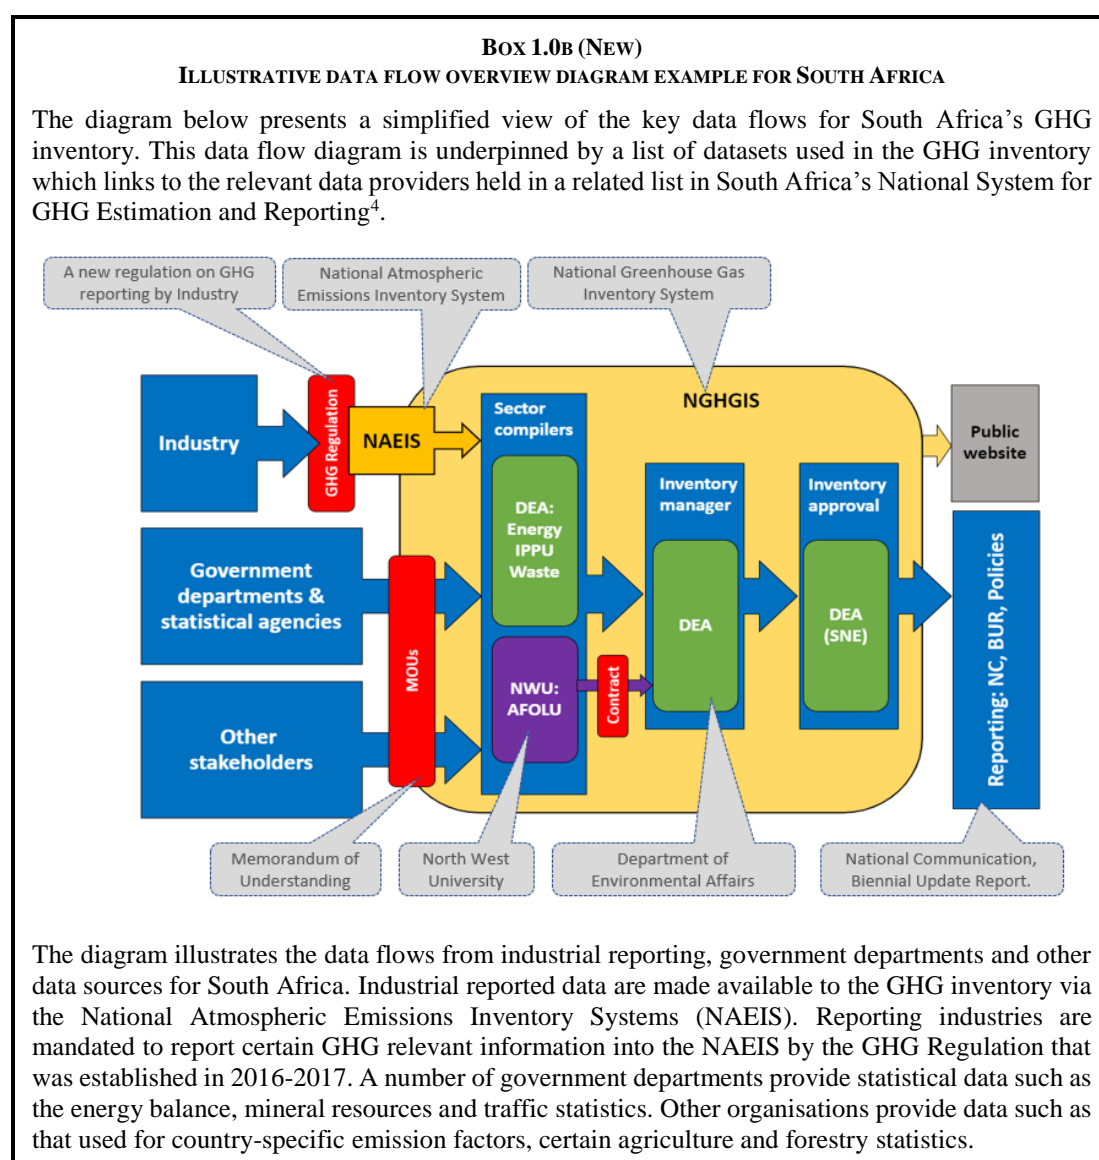

³ Linked to the quality principles (TCCCA referred to in Volume 1).

1.4.1.8 DATA PROVIDERS

Chapter 2 provides detailed identification of relevant data providers and sources of data. National statistical agencies often have a central role in a country's statistical data collection. Further suggestions for the formalisation of agreements with data suppliers are provided in section 1.4.2.2.

1.4.2 Datasets and data flows

There are numerous datasets needed for GHG inventory compilation and many data providers (including national statistical agencies, research institutes, government ministries, etc.) who provide them. Approaches for data collection are provided in Chapter 2. Mapping the “flow” of data, in the form of a diagram, from initial data collection to final reporting, further documents and highlights important data providers for the inventory compilation process. An illustrative example of such a diagram is provided in Box 1.0b.

More detailed data flows for specific datasets, sectors, or categories can help document the process, improve transparency and build institutional memory.

⁴ Own construction based on the South Africa's 2nd Biennial Update Report. (Available at: <https://unfccc.int/documents/39835>).

Final Draft

315 **1.4.2.1 ARCHIVE OF DATASETS**

316 An important component of institutional arrangements is a systematic approach to data management and the
317 collection of data. A first step is to create and maintain an archive and list of the datasets that are needed for the
318 GHG inventory compilation. This archive and list, which can be established for each sector or as a centralised
319 entity, will help to build and maintain institutional memory and support efficient and transparent compilation of
320 regular updates. An illustrative outline for a list of datasets is presented in Table 1.5.

TABLE 1.5 (NEW) ILLUSTRATIVE LIST OF DATASETS USED IN THE GHG INVENTORY							
1.Name	2.Status	3.Description	4.Reference	5.Location	6.Data Provider	7.Sector/ category	8.Update

1. **Name:** This should be a unique name for the dataset.
2. **Status:** Provide a status to indicate if the dataset is received or pending receipt, outdated etc.
3. **Description:** A description of the dataset.
4. **Reference:** A reference or link to a relevant data supply agreement if it exists (see section 1.4.2.2).
5. **Location:** Where the received data are stored within the GHG Inventory archive.
6. **Data Provider:** The provider of the data.
7. **Sector/category:** The sectors/categories of relevance to the dataset.
8. **Update:** The regularity that the dataset is updated.

1.4.2.2 DATA SUPPLY AGREEMENTS (DSAs)

Chapter 2 on data collection refers to the establishment of agreements formalising data supply. A data supply agreement (DSA) is a document that defines what data, from whom, to whom, and when it will be supplied for GHG inventory compilation. This can be useful for managing a regularly updated GHG inventory. Ideally, a DSA is arranged between the GHG inventory SNE and the data supplier stakeholder.

There are many potential DSA formats. Where there are national laws for data supply, these can be referenced. Where data supply is less formal, DSAs act as an informal specification. Suitable examples of DSAs can be found in many of the countries that are Annex I Parties to the UNFCCC. Suggested contents, taken from examples of DSAs⁵, that could form part of an agreement document exchanged between the GHG Inventory SNE and the data supplier stakeholder are provided below:

- background on the needs/mandate for the GHG inventory compilation;
- reference to laws/terms of reference and co-operation between the data supplier and the GHG inventory representatives;
- objectives of the agreement with reference to an annex specifying the details;
- confidentiality provisions and commitments;
- feedback provisions that enable the receiving party provide feedback to the supplier to promote continuous improvement of data collection;
- signatures of GHG inventory representative and data supplier, if appropriate;
- technical annex containing details of the data to be supplied, including:
 - (i) unique title of the dataset (to avoid confusion with other datasets);
 - (ii) confidentiality flags;
 - (iii) description including format (electronic format) and scope (time-series, detail, nomenclature, categories, geographies);
 - (iv) supplying department/service;
 - (v) deadlines for supply;
 - (vi) details of QA/QC applied to the data prior to supply;
 - (vii) uncertainties in the data.

A generic template for the development of a DSA in the form of a memorandum of understanding with a data supplier can be found in the National Greenhouse Gas Inventory Templates developed by the United States

⁵ There are many countries (e.g. United Kingdom, Austria and South Africa) that are working with and developing DSAs.

Final Draft

Environmental Protection Agency and United States Agency for International Development hosted by the LEDs group (EPA 2016).

1.5 COMPILING AN INVENTORY

No refinement.

1.6 GHG INVENTORY MANAGEMENT TOOLS

The development of GHG inventory management tools will help to ensure efficiency and transparency in the GHG inventory compilation activities throughout the steps identified in the compilation cycle in Figure 1.1 of section 1.5 of the *2006 IPCC Guidelines*. Tools include workplans, improvement plans, data management systems, quality systems, training and capacity building and documentation procedures.

The tools in this section should not be considered prescriptive. They provide some suggested approaches and examples demonstrated to be useful when developing sustainable GHG inventory systems that will improve quality⁶, timeliness, and use of resources.

1.6.1 Workplans

National GHG inventories compiled/updated on a regular basis can benefit from the development of a clearly defined workplan, which clarifies the schedule of steps for generating GHG inventory outputs. An illustrative example workplan for a regular inventory update cycle is presented in Table 1.6. Workplans should be reviewed, and where necessary, revised prior to the start of a new inventory update cycle. The GHG inventory manager/coordinator should maintain these workplans and formalize them with GHG inventory compilation contributors through communication of the workplan.

⁶ Transparency, accuracy, completeness, consistency and comparability.

TABLE 1.6 (NEW) ILLUSTRATIVE WORKPLAN FOR THE PREPARATION OF A GHG INVENTORY INCLUDING AN INDICATIVE TIMELINE

Reporting and other deliverables to stakeholders and national decision-making processes	Week 50-52	

379

380 1.6.2 Data management system

381 The process of GHG inventory preparation involves numerous datasets compiled using an array of assumptions
382 and expert judgement. Sectors and categories will use different data, data formats, data manipulations, and tools
383 for their compilation (see Volume 1, Chapter 2).

384 There are many different data management systems used by countries. Some use sophisticated database tools
385 connected to the internet and available for users to upload data and to operate from remote locations. However,
386 many countries currently operate using a collection of spreadsheets, databases and bespoke software systems for

⁷ Milestones should be specified as specific calendar dates.

Final Draft

calculating GHG estimates. Some key points around the differences between data management systems needed for calculating estimates and for aggregating and reporting GHG inventory data are provided below:

Calculating of GHG Estimates: Sector compilation experts need flexibility to compile estimates using tools appropriate to national circumstances, including the complexity of their data and methods. Specialised models or spreadsheets may be appropriate. Spreadsheets are often used when starting out and for developing methods, as they are accessible to a range of experts. More complex methods will often entail use of specialised models or databases to facilitate complex calculations and/or the handling of large datasets. Whatever tools are used, applying a common practice for documentation within calculation tools including the following points should be considered:

1. using standard classification and nomenclatures for compilation of estimates (this nomenclature can be based on country-specific or IPCC or other recognised classifications (e.g. United Nations Statistics Division (UNSD) classifications⁸);
2. including metadata in each file and maintaining a master list of the calculation files, their types, authors, and versions;
3. using a standard file naming convention across categories and inventory cycles;
4. documentation in tools with evidence of the implementation of QA/QC procedures;
5. colour coding or other visual formatting to differentiate between areas of data input, calculations, QA/QC checks, explanations, and outputs;
6. documenting where historical data or methods have been revised;
7. documentation of complex models (see Volume 1, Chapter 6); and
8. standard output format for all reported data.

Collation, Aggregation and Reporting: For analysis and reporting, inventory data needs to be collated into a coherent set of tables that can be aggregated to produce detailed reporting formats, national totals, and summary tables. This collation also enables general QA/QC to be applied more easily using tools to identify anomalies in trends and missing categories. The suggested information in a standardised data structure for collating time-series data is presented in the Table 1.7 below:

TABLE 1.7 (NEW)									
SUGGESTED INFORMATION IN A STANDARDISED DATA STRUCTURE FOR COLLATING TIME-SERIES DATA									
1.Year	2.National Nomenclature	3.Reporting Nomenclature	4.Geography	5.Gas	6.Type of variable	7.Value	8.Units	9.Notation Keys	10.Reference

1. Year (the year of the value in the time-series).
2. National nomenclature (if relevant the nomenclature used nationally and linked to the statistics, national definitions and/or source data, allowing reports for national use in a nomenclature familiar to national actors and stakeholders).
3. Reporting nomenclature (e.g. IPCC categories and fuels/activities).
4. Geography (identifying which part of the national geographical area is represented).
5. Gas/pollutant.
6. Type of variable (e.g. emission/removal, activity data, implied emission factor).
7. The variable value.
8. Variable units.
9. Notation key (if relevant).
10. Reference/description of updates since previous compilation; and reference for the source of the value (calculation file).

1.6.3 Management of QA/QC & documentation material

Extensive guidance on QA/QC and documentation is presented in Volume 1, Chapter 6. The following components could be considered as part of QA/QC management and documentation of the GHG inventory:

- **QA/QC Plan** (see section 6.5 of the QA/QC chapter of the *2006 IPCC Guidelines*), including general and category-specific QC procedures (see sections 6.6 and 6.7).
- **A log of implemented QA/QC and verification activities** with reference to associated documentation and findings (see sections 6.8 and 6.10 of the QA/QC chapter).
- **An inventory improvement plan** containing potential, planned and implemented improvements. This plan may include a simple table as illustrated in Table 1.8:

TABLE 1.8 (NEW) SUGGESTED DESCRIPTION OF POTENTIAL, PLANNED AND IMPLEMENTED IMPROVEMENTS IN INVENTORY IMPROVEMENT PLAN						
1. Categorisation	2. Name	3. Description	4.Origin	5.Status	6.Priority	7.Owner

1. The **categorization** of the improvement. This could include the sector or categories, and the type of improvement activity (e.g. improved QA/QC processes, improved uncertainties or key category analysis, improving activity data, moving to higher tier methods).

2. A short unique **name**.

3. Improvement **description** including information on timeframes and technicalities for development.

4. The **origin** of the improvement (e.g. recommendation or expert suggestion or international review process).

5. The **status** (e.g. suggested, proposed, planned, work in progress, implemented) of the improvement.

6. The **priority** of the improvement (informed by the *key category* analysis).

7. The **owner** is the person or entity responsible for implementing the improvement.

- **An inventory archive** (see section 6.11 of the QA/QC chapter) that structures and stores data on the latest and previous GHG inventory estimates, reports, methodology documents, and calculation files.
- **Country-specific training material** addressing country-specific methods and data management tools.

1.6.4 GHG inventory training activities

Suitably trained and/or experienced GHG inventory experts should support the national GHG inventory system to efficiently produce high quality outputs. Training and experience development can be focussed in three areas:

- Training in the methods in the latest *IPCC Guidelines* available from a number of training services and the UNFCCC/IPCC.
- Training in the application of relevant *IPCC Guidelines* to the country circumstances. This training may include country-specific or international courses and material.
- Participation in international review processes (e.g. UNFCCC process), which can provide experts with broader experience with GHG inventories undertaken by other countries.

Ready access to training and regular review participation will help build national capacity, understanding of international reporting requirements, and enhance sustainability of the national GHG inventory arrangements. It may be helpful for the Single National Entity to maintain a roster of identified trainers and archive of training material.

1.6.5 Education, awareness raising and public access to the information

A national GHG inventory can provide information (e.g. increasing or decreasing trends and sectoral contributions) to support stakeholder decision making. Education-related activities aimed at stakeholders (e.g. relevant

Final Draft

government ministries) can help develop their technical capacity, enhance cooperation, and improve their knowledge that can in turn contribute to the continuous improvement of the GHG inventory.

There are activities that can be useful in promoting the GHG inventory processes and outputs. Some examples of such activities include:

- Organizing GHG inventory orientated **workshops with stakeholders**. These can range from technical workshops focused on overall inventory results or on specific sectors to awareness raising events for mass media
- **Publication of the GHG inventory data in user-friendly forms** using visual tools such as infographics to engage with wider stakeholders, students, the press and policy makers.
- **Development of overview and sector specific indicators and factsheets** highlighting key stories on the trends and progress to targets.
