

# **Breakout Group 3** Biogenic processes and storage

Vienna, Austria – 2 & 3 July 2024

- Andrew Lenton Bamikole Jacques Kouazounde Bong-Oh Kwon Claudia Kammann Dominic Woolf Jan Fuglestvedt Giacomo Grassi
- Maheswar Rupakheti

Maria Jose Sanz Sanchez Marta Camps Arbestain Martial Bernoux Rizaldi Boer Stephen Ogle

# **Breakout Group main objectives**

1. Discuss and refine the evaluation criteria.

2.Learn about new **CDR** based on biological processes and develop methods for estimating CO<sub>2</sub> capture and long-term storage.

3.Identify and highlight potential important issues for future meetings and authors of the methodological guide.

### Index

### **Guiding Questions:**

- Question 1 Assessment Criteria
- Question 2 Completeness
- Question 3 Taxonomy of sources and sinks
- Question 4 Preliminary assessment of existing IPCC Guidelines estimation methodologies
- Question 5 Feasibility of Tier 1 methods
- Question 6 Higher tier methods
- Question 7 Verification Activities

#### Appendix

- Possible Criteria for assessing new methods
- CDR pathways by type of technology

## Framing issue

- "Technology" issue:
  - In the absence of clear definition we assume all what was considered is "technology";
  - depending the definition that will be adopted this can have impact/consequences on the "anthropogenic" approach for the AFOLU which is based on manage land proxy.
- We discuss both completely new methods as well as refining methods
- Geographical scope: our discussion went beyond land into territorial waters

Original table for BOG3

Group	The IPCC WGIII AR6 Report examples of CDR methods
Anthropogenic biological (photosynthesis) – biomass	<ul> <li>Afforestation/Reforestation</li> <li>Agroforestry</li> <li>Improved Forest Management</li> <li>"Blue carbon management" in coastal wetlands</li> </ul>
Anthropogenic biological (photosynthesis) – soils and waterways	<ul> <li>Soil carbon sequestration in croplands and grasslands</li> <li>Peatland and coastal wetland restoration</li> <li>Biochar</li> </ul>

Source: Derived from IPCC 2022 – IPCC WGIII Mitigation of Climate Change, Technical Summary.

\*Additional - not included in the source data

Group	The IPCC WGIII AR6 Report examples of CDR methods	Q3- Taxonomy	Q4—Methodology
Anthropogenic biological (photosynthesis ) – <u>biomass</u>	<ul> <li>Afforestation/Reforestation</li> </ul>	• No	<ul> <li>No need for improvement at Tier 1; No need for improvement &gt; Tiers.</li> </ul>
	Agroforestry	• No	<ul> <li>May be (update EF1 – Cstock <u>or EFDB update</u>)</li> </ul>
	<ul> <li>Improved Forest</li> <li>Management</li> </ul>	• No	<ul> <li>No need for improvement at Tier 1; No need for improvement &gt; Tiers.</li> </ul>
	<ul> <li>"Blue carbon management" in coastal wetlands (seagrass meadow, macro algae)</li> </ul>	• Yes	<ul> <li>Develop Tier 1 EF (not covered in Wetlands Supplement - Chapter Coastal Wetlands) for seagrass, tidal marshes; develop Tier 1 EF for macro algae#. Develop Tier 2 (but see "Guidance for authors on taxonomy"); Lateral transfer of biomass</li> </ul>
	Ocean fertilization	• No*	• No

\*In view of international agreements allowing or prohibiting certain activities, e.g. according to the London Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter); no clear evidence of C sequestration from experiments (satellite monitoring); issue of national boundaries (less nutrient limitation in territorial waters: probably more affected in open ocean – international waters - that in territorial waters) # Most probably not enough information to develop Tier 1 EF

VERIFICATION: Blue Carbon: might be challenging due to lateral transfer (floating biomass) in the tidal zone

Group	The IPCC WGIII AR6 Report examples of CDR methods	Q3- Taxono my	Q4—Methodology (Tier1)
Anthropogenic biological (photosynthesis) – soils and waterways	<ul> <li>Soil carbon sequestration in croplands and grasslands</li> </ul>	No	<ul> <li>Tier 1 - May be: SOCref possible to develop for deeper depths; inputs/LU factors might be updated and extended to a deeper depth); Could consider develop an alternative Tier 1 approach taking into account changes before and after 20 years for LUC, or at least elaboration on the impact (box)</li> <li>&gt; Tiers: additional guidance to consider DEM at Tier 3 level)</li> </ul>
	Organic Soils and Peatland and coastal wetlands-restoration	Yes*	<ul> <li>Tier 1: Not sure (no expert in the BOG). Default EF1 factors in the 2013 Wetland Supplement - Chapter 3: Rewetted Organic Soil, might be updated; Update the DOC EF; Develop lateral transfer (DIC, POC); Revisit EF Tier 1 for CH4 and N2O. Consider stratify EF based on water table depth</li> </ul>
			<ul> <li>&gt; Tiers: Lateral transfer (DIC, POC); Probably enough new science to consider the impact of the water table level at higher Tiers.</li> </ul>
	<ul> <li>"Blue carbon management" in coastal wetlands (mud flats,seagrass bed, subtidal sediments)</li> </ul>	Yes	<ul> <li>Tier1: might expand (sea grass) or develop (mud flats and subtidals), considering DIC, DOC, POC;</li> <li>&gt; Tiers: Need to considered lateral transfer of sediment;</li> </ul>
VERIFICATION	Soil C (Possible and quidance av	ailahle as	needed). Blue Carbon, might be challenging for the

ipcc

(👌) UN 🙃

VERIFICATION: Soil C (Possible and guidance available as needed); Blue Carbon: might be challenging for sediments, due to lateral transfer in the tidal zone

TERGOVERNMENTAL PANEL ON **Climate ch** 

**INCC** 

Group	The IPCC WGIII AR6 Report examples of CDR methods	Q3- Taxono my	Q4—Methodology (Tier1)
Anthropogenic biological (photosynthesis) – soils and waterways	• Biochar	Yes	• No Tier 1 for soil, (Basis for future methodological development of a Tier1 method in Appendix, but only for cropland/grassland); Need to consider the effect on the direct N <sub>2</sub> O emissions.
			<ul> <li>Develop/update information on derivation of FC<sub>p</sub> and Fperm<sub>p</sub> values need to be considered (including evaluate the feasibility of develop alternative methods based on pyrolysis temperature or ratios, e.g. H/OC).</li> </ul>
			<ul> <li>Consider expands at Tier1 to other land use (settlement, wetlands, forest) and other sectors (e.g. construction material)</li> </ul>
			<ul> <li>Develop production level (sub)category for Biochar and consider the trade issue in the methodology to avoid double counting, based on where the biochar is applied.</li> </ul>
			<ul> <li>Production of syngas and oil in the Energy Sector and potential for storage in geological reservoir.</li> </ul>
			<ul> <li>&gt; Tiers: Some guidance already available. Impacts of different soil types / Impact of climate zones on EFs (for biochar with H/OC between 0.4 and 0.7) where it is applied; Considered eventual priming effect for verification.</li> </ul>

VERIFICATION: Biochar consider using available registry on biochar/CDR at country level; Verification at production phase seems not an issue, might be more complex at application side

#### Issues for cross bog discussion

Group	The IPCC WGIII AR6 Report examples of CDR methods	Q3-Taxonomy	Q4—Methodology
Anthropogenic biological (photosynthesis) – Soils? <u>Oceans? Or</u> <u>geological</u> <u>reservoirs</u>	<ul> <li>Biomass burial, Slurry and Oil*</li> </ul>	<ul> <li>May be (new category [on top of] HWP or waste)</li> </ul>	<ul> <li>May be not enough information for EF Tiers; Need a taxonomy (type of burial, type of material: raw, dried, processed, etc); need to consider all GHGs (likely not enough science/information);</li> <li>&gt; Tiers; no further consideration</li> </ul>

\* Risk of leakage on mid to long-term to be evaluated (risk of pollution from the "products" and/or "additives" and/or "packaging"); Loss of carbon and/or nutrients for the terrestrial or ocean agro-ecosystems; Changing oxygen levels in oceans; Impact on the waste sectors; National regulations/laws on waste/biomass deposition; Ensure the loss of biomass and the GHG associated with the production, is counted in the productive system(s); international trade and potential issues with double counting (similar to HWP); Verification: not feasible if ocean, should be possible in terrestrial.

### Further guidance for authors for "blue carbone"

- Consider developing a clear taxonomy for "Blue carbon management" in coastal wetlands
- Consider different species for each 'subcategory'
- Potential lateral transfer (potential double counting in sediments)
