

Use of the IPCC Inventory Software to Establish the National GHG inventory in the Agriculture, Forestry and Other Land Use (AFOLU) sector Livestock categories

IPCC TFI TSU

ipcc

INTERGOVERNMENTAL PANEL ON climate change

IPCC Guidelines

□ Volume 4 (AFOLU), Chapters 10 and 11*

✓ 2006 IPCC Guidelines

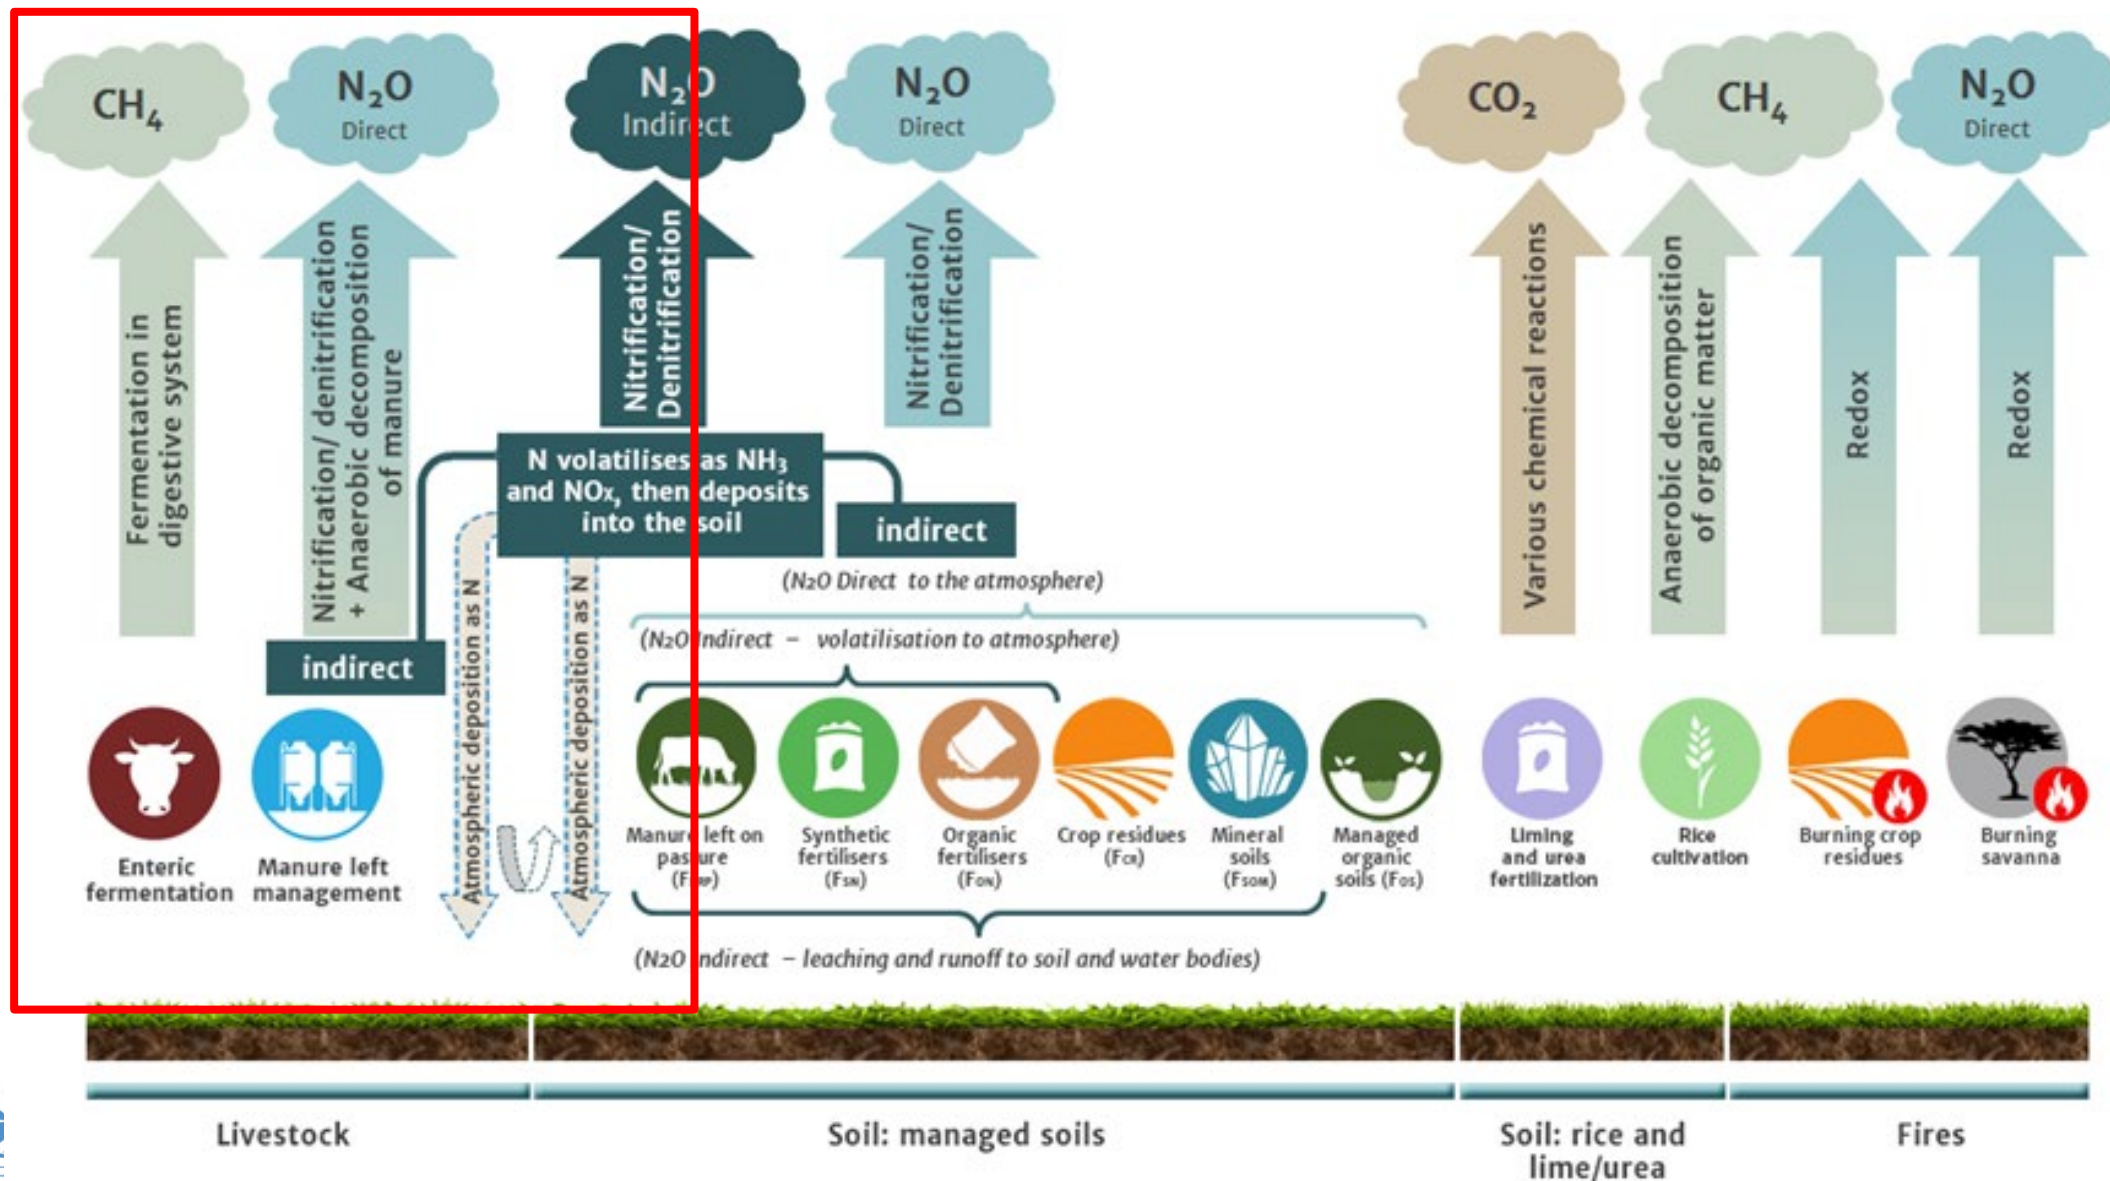

✓ 2019 Refinement

* Limited to EF₄ and EF₅ for indirect N₂O emissions from manure management (category 3.C.6)

Processes covered by IPCC Guidance on AFOLU

GHG emissions in Agriculture

Organic Matter

- ❑ **Organic matter is heterogeneous very complex compound. Generally, as weight, is**
 - 45–55% Carbon
 - 35–45% Oxygen
 - 3–5% Hydrogen
 - 1–4% Nitrogen
- ❑ **Organic matter is the component of**
 - Biomass, living organic matter, which can have
 - Either an annual cycle [Growth → Harvest&Consumption or Decay to dead organic matter]
 - Or a multiyear cycle [Growth in plant perennial tissues (wood)] and thus stores Carbon across years
 - Dead organic matter, dead wood, litter, soil organic matter, harvested wood products which stores Carbon across years

Organic Matter

❑ Organic matter redox/decay processes timescale

- *hours*
- *within a year*
- *years/centuries*
- *centuries/millennia*

❑ Organic matter redox/decay results in

- $\text{CO}_2, \text{CH}_4, \text{N}_2\text{O}$
- $\text{NH}_3/\text{NH}_4^+, \text{NO}_x$
- $\text{H}_2\text{O}, \text{N}_2$

Chemicals

❑ Synthetic Nitrogen fertilizers

=> N₂O emissions

❑ Mineral Carbonaceous amendments

=> CO₂ emissions

❑ Nitrogen/Carbonaceous fertilizers (Urea)

=> N₂O + CO₂ emissions

Notations

- ❑ **Nitrogen** content of **N₂O** is indicated as **N₂O-N**, and emissions of N₂O-N are **converted** to N₂O emissions multiplying **by 44/28** (proportion of the atomic weight of the two molecules)
- ❑ **Carbon** content of **CH₄** is indicated as **CH₄-C**, and emissions of CH₄-C are **converted** to CH₄ emissions multiplying **by 16/12** (proportion of the atomic weight of the two molecules)
- ❑ **Carbon** content of **CO₂** is indicated as **CO₂-C**, and emissions of CO₂-C are **converted** to CO₂ emissions multiplying **by 44/12** (proportion of the atomic weight of the two molecules)
- ❑ **Emissions** have a **positive sign**, while **CO₂ removals** have a **negative sign**. *This is because the “point of view” of an NGHGI is the atmosphere, so a positive sign means an addition of GHG to the atmosphere, while a negative sign means a subtraction of CO₂ from the atmosphere*
- ❑ **Carbon stock gains** have a **positive sign**, while **Carbon stock losses** have a **negative sign**. *This is because the “point of view” is the C pool to which the C stock pertains, so a positive sign means an addition of Carbon to the C pool, while a negative sign means a subtraction of C stock from the C pool*
- ❑ Thus, **converting** a net **C stock** change to **CO₂ net emission/removal** requires to multiplying the net C stock **by -44/12**, *given that the sign is to be changed*

Stratification of Activity Data

❑ Stratification of activity data promotes accuracy and precision since:

- ✓ Subdivisions are more homogenous than the whole population, *and thus associated EF are more accurate and precise*
- ✓ Propagation of random error, as it occurs summing up subdivisions' estimates, tends to cancel those out -*Systematic Errors instead DO NOT cancel out across propagation-*

Systematic Errors instead DO NOT cancel out across propagation, thus, GOOD PRACTICE is to always REMOVING any identified SYSTEMATIC ERROR *-a biased estimate is NOT acceptable in an NGHGI-*; while minimizing RANDOM ERRORS *-these indeed cannot be zeroed!-*.

Random errors do bias neither the level of emissions/removals estimated nor the estimated change across time (mitigation); while Systematic errors do.

Livestock

3.A – Livestock

Category	Activity	GHGs
3.A.1	Enteric Fermentation	CH ₄
3.A.2	Manure Management	CH ₄ – N ₂ O

Volume 4, Chapter 10

Livestock

□ Annual Biomass as feed

- Enteric Fermentation – CH_4 [3.A.1]
 - Metabolism – CO_2
 - Manure
 - Uncollected (Urine & Dung left on pasture) – CO_2 , N_2O direct/indirect [3.C.4/3.C.5]
 - Collected (Manure Management) – CO_2 , CH_4 & direct N_2O [3.A.2], indirect N_2O [3.C.6]
- & Applied to soil – N_2O direct/indirect [3.C.4/3.C.5]

Annual biomass within the year uptakes CO_2 as it grows and releases, because redox biological or physio-chemical processes, and transfers it to other C pools as mortality

3.A – Livestock

Given a livestock population, **Diet** (*quantity and quality of feed*) -estimated as average daily feed intake (and its quality)- is the main determinant of Enteric Fermentation & Manure production

Ruminants (e.g. cattle, sheep) -> non-Ruminants (e.g. pigs, horses)

CH₄ emissions are driven by the energy content of feed, its digestibility, and its use

N₂O emissions are driven by the protein content of feed and its use

3.A – Livestock – Activity Data

❑ IPCC default methodology:

- Population (*number of heads*), Stratification: Basic Characterisation
- Manure Management Systems (MMS) –for *Manure Management* only
- Typical Animal Mass (kg) –for N₂O emissions from *Manure Management* only

❑ Tier 2 IPCC methodology

- Population (*number of heads*), Stratification: Enhanced Characterisation
- Body Weight/Typical Animal Mass (kg)
- Average Daily Feed Intake (either MJ or kg DMI per day)
- Manure Management Systems (MMS) –for *Manure Management* only

3.A – Livestock – Feed Intake

☐ **Feed intake** is measured:

- ✓ either as **Gross Energy (GE)** - *Mega Joules (MJ) per day*
- ✓ or as **Dry Matter** - *kilograms (kg) per day*

Dry Matter Intake (DMI) is the amount of feed consumed (kg) after it has been corrected for the water content.

☐ To estimate **average daily feed intake for each subcategory/subdivision**, *good practice* is to collect data on:

- ✓ **Animal's typical diet** (digestibility/energy content/protein content)
- ✓ **Performance** (growth/production/work)

3.A – Livestock – Gross Energy

- ❑ **Average Daily Feed Intake** (kg d.m./day) can be **derived through** the daily **Gross Energy** (MJ/day) **needed** by the animal **for maintenance and for activities** such:
 - ✓ Net Energy for maintenance (NE_m)
 - ✓ Net Energy for activity (NE_a)
 - ✓ Net Energy for pregnancy (NE_p)
 - ✓ Net Energy for lactation (NE_l)
 - ✓ Net Energy for growth (NE_g)
 - ✓ Net energy for wool (NE_{wool})
 - ✓ Net Energy for work (NE_{work})
- ❑ **From the Gross Energy (GE)**, the Dry Matter Intake (**DMI**) (kg d.m./day) **is then calculated by dividing GE by the Energy Density of Feed (MJ/kg).**

Tier 2 AD – Average Daily Feed Intake – Livestock 3.A – CH₄,N₂O

Parameter			Equation	IPCC Default	
Tier 2 Approach	Average Daily Feed Intake	Detailed	Net Energy for Maintenance [NEm]	10.3 & 10.2 for Cf_{i_cold}	Table 10.4 for Cf_i – Tables 10.10 & 10A.1-9 for animal weight

IV. Volatile Solid Excretion Rate (*Tier 2*)

CH₄ emissions from Manure Management

V. N Excretion Rate

Direct (& Indirect) N₂O emissions from Manure Management

3.A – AD Steps to GHG estimates [1-3]

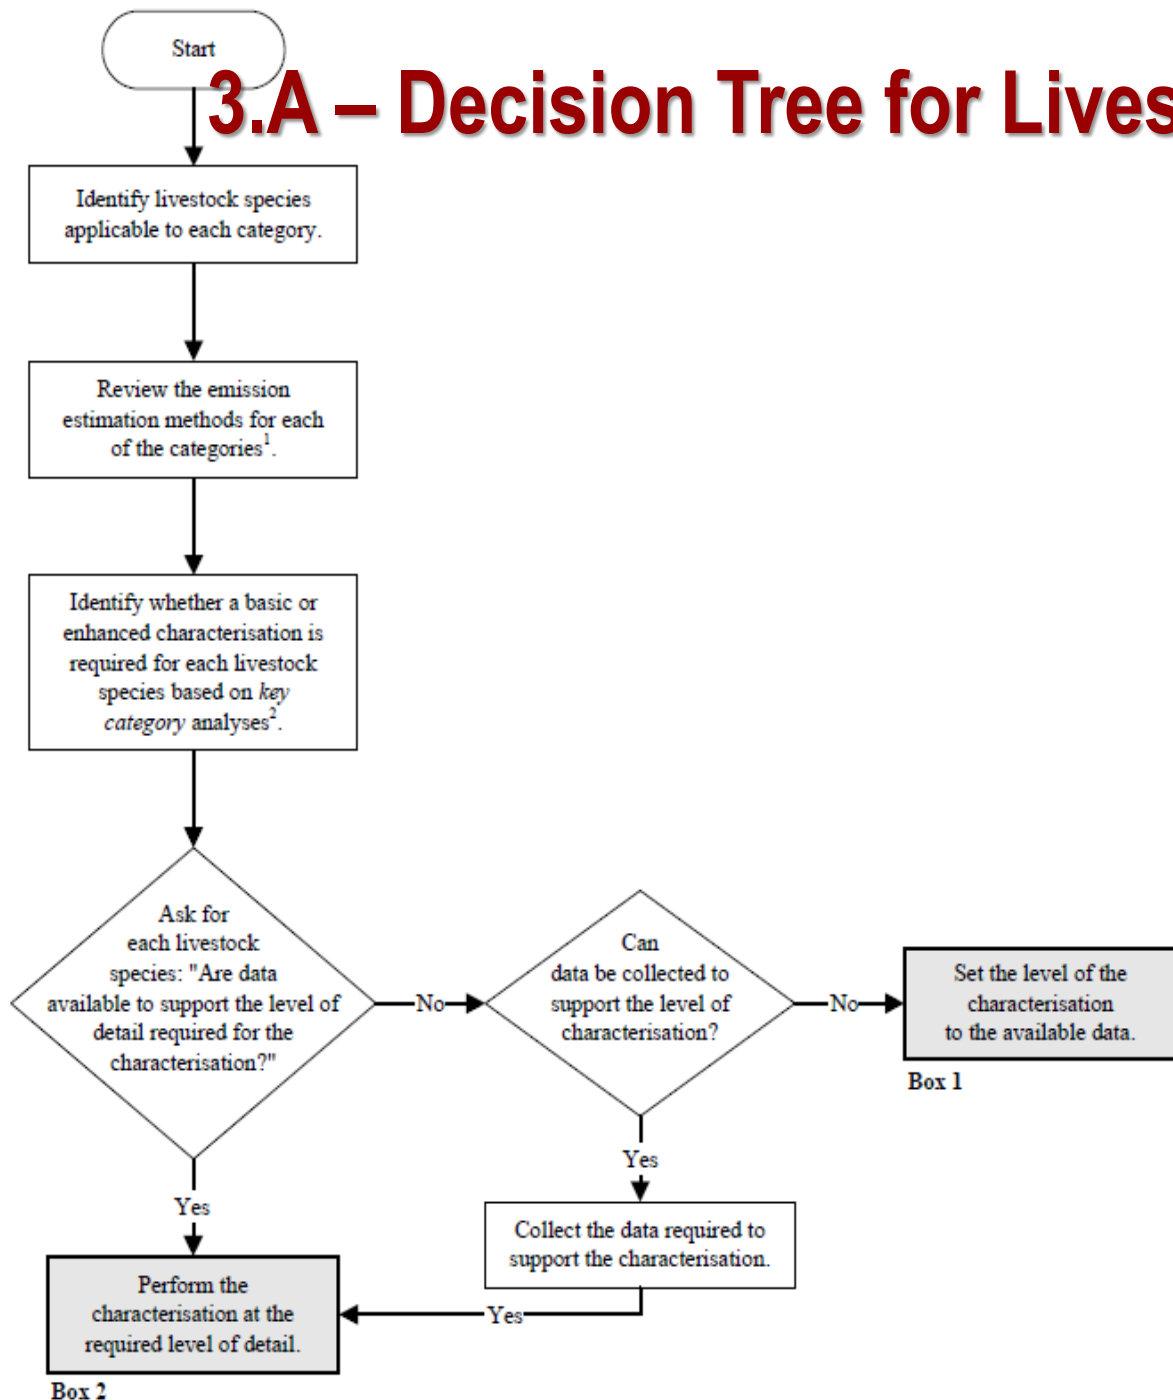

1. Assess whether a domestic population exist
2. Assess whether the Population is to be disaggregated in different subunits -“Regions” in the Software- according to a variable of interest as:
 - ✓ geographical distribution,
 - ✓ husbandry system
 - ✓ administrative units (if any)
3. Applies the IPCC Decision Tree at the level of each subunit (different tiers may be applied to different subunits of the same population) to assess:
 - A. which methodological Tier is to be applied and thus
 - B. the relevant Livestock Characterisation to be applied

3.A – Decision Tree for Methodological Tier – Fig 10.2

To be repeated for
each Livestock species and GHG in each *Region*

3.A – Decision Tree for Livestock Characterisation – Fig 10.1

To be repeated for
each Livestock species in each *Region*

3.A – AD Steps to GHG estimates [4]

4. Define categories and subcategories of the *Livestock Characterisation*

*The livestock population subcategories/subdivisions are defined to create relatively homogenous sub-groupings of animals. The Enhanced characterisation seeks to define animal growth stage, productivity, diet quality and management circumstances to support a more accurate estimate of the **average daily feed intake**.*

3.A – IPCC categories 2006 IPCC Guidelines vs 2019 Refinement

TABLE 10.1 REPRESENTATIVE LIVESTOCK CATEGORIES ^{1,2}	
Main categories	Subcategories
Mature Dairy Cow or Mature Dairy Buffalo	<ul style="list-style-type: none"> High-producing cows that have calved at least once and are used principally for milk production Low-producing cows that have calved at least once and are used principally for milk production
Other Mature Cattle or Mature Non-dairy Buffalo	<p>Females:</p> <ul style="list-style-type: none"> Cows used to produce offspring for meat Cows used for more than one production purpose: milk, meat, draft <p>Males:</p> <ul style="list-style-type: none"> Bulls used principally for breeding purposes Bullocks used principally for draft power
Growing Cattle or Growing Buffalo	<ul style="list-style-type: none"> Calves pre-weaning Replacement dairy heifers Growing / fattening cattle or buffalo post-weaning Feedlot-fed cattle on diets containing > 90 % concentrates
Mature Ewes	<ul style="list-style-type: none"> Breeding ewes for production of offspring and wool production Milking ewes where commercial milk production is the primary purpose
Other Mature Sheep (>1 year)	<ul style="list-style-type: none"> No further sub-categorisation recommended
Growing Lambs	<ul style="list-style-type: none"> Intact males Castrates Females

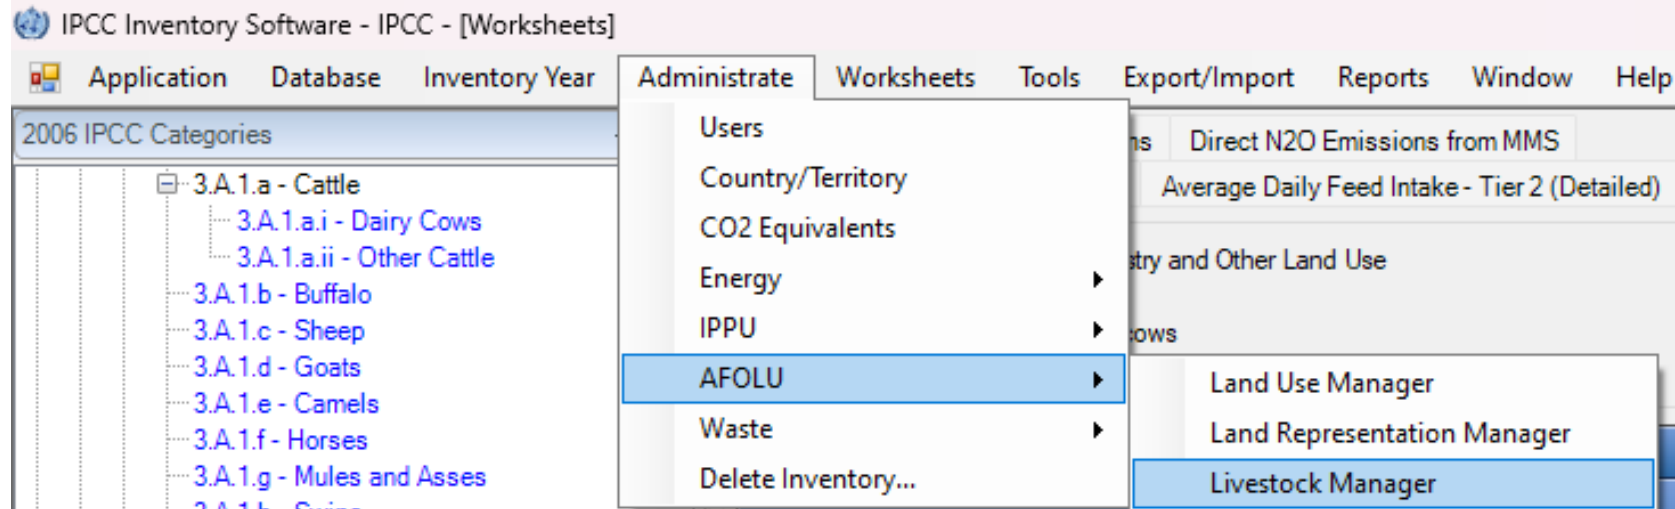

3.A – IPCC categories 2006 *IPCC Guidelines* vs 2019 Refinement

TABLE 10.1 (UPDATED) Representative livestock categories ^{1,2}		
Main categories	Production categories Tier 1a	Subcategories
Mature Dairy Cow or Mature Dairy Buffalo	High Productivity Systems	High-producing cows that have calved at least once and are used principally for milk production
	Low Productivity Systems	Low-producing cows that have calved at least once and are used principally for milk production
Other Mature Cattle or Mature Non-dairy Buffalo	High Productivity Systems	Females:
		• Cows used to produce offspring for meat
		• Cows used for more than one production purpose: milk, meat, draft
		Males:
		• Bulls used principally for breeding purposes
	Low Productivity Systems	Females:
		• Cows that may be used for more than one production purpose: milk, meat, draft
		Males:
		• Bullocks used principally for draft power
Growing Cattle or Growing Buffalo	High Productivity Systems	• Calves pre-weaning
		• Replacement dairy heifers
		• Growing / fattening cattle or buffalo post-weaning
		• Feedlot-fed cattle on diets containing > 85% concentrates
	Low Productivity Systems	• Calves pre-weaning
		• Growing / fattening cattle or buffalo post-weaning

3.A – AD Steps to GHG estimates [4]

4. Enter the *Livestock Characterisation*

- Note that the Software allows one single Livestock characterisation and thus where subunits requires different Characterisation of the population, all categories, subcategories, subdivisions are compiled altogether in the relevant TAB of the Software
- *Livestock Characterisation*, is entered in the *Livestock manager*

Case Study for Livestock - Cattle

□ 3 Regions with

➤ 3 different climate zones

A. Annual Average Temperature 26°C

B. Annual Average Temperature 20°C

C. Annual Average Temperature 14°C

➤ 2 different Livestock Characterisations

I. Basic (*Tier 1*) – Dairy cows, Other cattle,

II. Enhanced (*Tier 2*) – Mature Dairy Cows, Growing Cattle, Other Mature Cattle

➤ 4 different Manure Management Systems

1. Pasture/Range/Paddock (*Region A only*)

2. Pasture/Paddock (6 months) + Solid Storage & Spread (*All Regions*)

3. Liquid Slurry (6 months) + Spread (*Region B only*)

4. Anaerobic Digester (*Region B only*)

The IPCC Inventory Software

- ❑ All methods in the 2006 IPCC Guidelines and its Wetlands Supplement are implemented in the IPCC Inventory Software

Thus, needed flexibility to deal with any national circumstances, as per IPCC tiered approach, is ensured

- ❑ Subnational disaggregation (Geographical Zone)

Thus, tracking of specific activities/projects, and associated emission level & trend, within a national GHG inventory is allowed

- ❑ Interoperability with UNFCCC ETF reporting tool allows to export a complete set of CRTs and upload it in the UNFCCC ETF reporting tool

User-specific Tier 3 estimates to be accommodated in Tier 1 methodological approach worksheets

- ❑ AFOLU sector Guidebook – version 1 under development

Case Study for Livestock - Cattle

□ Estimate

- CH₄ emissions form Enteric Fermentation (3.A.1)
- CH₄ and N₂O emissions form Manure Management (3.A.2)
- Indirect N₂O emissions from Manure Management (3.C.6)

Geographical zones Liveness Characterisation Manure Management System			
			Save Undo Close
System	Definition		
Pasture/Range/Paddock	The manure from pasture and range grazing animals is allowed to lie as deposited, and is not managed.		
Daily spread	Manure is routinely removed from a confinement facility and is applied to cropland or pasture within 24 hours of excretion.		
Solid storage	The storage of manure, typically for a period of several months, in unconfined piles or stacks. Manure is able to be stacked due to the presence of a sufficient amount of bedding material or loss of moisture by evaporation.		
Dry lot	A paved or unpaved open confinement area without any significant vegetative cover where accumulating manure may be removed periodically.		
Liquid/Slurry	Manure is stored as excreted or with some minimal addition of water in either tanks or earthen ponds outside the animal housing, usually for periods less than one year.		
Uncovered anaerobic lagoon	A type of liquid storage system designed and operated to combine waste stabilization and storage. Lagoon supernatant is usually used to remove manure from the associated confinement facilities to the lagoon. Anaerobic lagoons are designed with varying lengths of storage (up to a year or greater), depending on the climate region, the volatile solids loading rate, and other operational factors. The water from the lagoon may be recycled as flush water or used to irrigate and fertilise fields.		
Pit storage below animal confinements	Collection and storage of manure usually with little or no added water typically below a slatted floor in an enclosed animal confinement facility, usually for periods less than one year.		
Anaerobic digester	Animal excreta with or without straw are collected and anaerobically digested in a large containment vessel or covered lagoon. Digesters are designed and operated for waste stabilization by the microbial reduction of complex organic compounds to CO ₂ and CH ₄ , which is captured and flared or used as a fuel.		
Burned for fuel	The dung and urine are excreted on fields. The sun dried dung cakes are burned for fuel.		
Cattle and Swine deep bedding	As manure accumulates, bedding is continually added to absorb moisture over a production cycle and possibly for as long as 6 to 12 months. This manure management system also is known as a bedded pack manure management system and may be combined with a dry lot or pasture.		
Composting - invessel	Composting, typically in an enclosed channel, with forced aeration and continuous mixing.		
Composting - Static pile	Composting in piles with forced aeration but no mixing.		
Composting - Intensive windrow	Composting in windrows with regular (at least daily) turning for mixing and aeration.		
Composting - Passive windrow	Composting in windrows with infrequent turning for mixing and aeration.		
Poultry manure with litter	Similar to cattle and swine deep bedding except usually not combined with a dry lot or pasture. Typically used for all poultry breeder flocks and for the production of meat type chickens (broilers) and other fowl.		
Poultry manure without litter	May be similar to open pits in enclosed animal confinement facilities or may be designed and operated to dry the manure as it accumulates. The latter is known as a high-rise manure management system and is a form of passive windrow composting when designed and operated properly.		
Aerobic treatment	The biological oxidation of manure collected as a liquid with either forced or natural aeration. Natural aeration is limited to aerobic and facultative ponds and wetland systems and is due primarily to photosynthesis. Hence, these systems typically become anoxic during periods without sunlight.		
► Pasture/Paddock (6 months) + Solid Storage	Spread after 6 months in Solid Storage		✗
Liquid Slurry (6 months) + Spread			✗
*			✗

Open the Calculation Worksheets

- ❑ Clicking on **blue categories** opens the relevant calculation worksheets where to enter AD, parameters and EFs for the category selected
- ❑ Data to characterize the Livestock population can be entered either for **3.A.1** (*Enteric Fermentation*) or **3.A.2** (*Manure Management*), the **Software** automatically copies the data in the other category

3.A.1 – Enteric Fermentation CH₄ emissions

3.A.2 – Manure Management CH₄ & direct N₂O emissions

Worksheet:

Livestock Population

Enter Annual Average Population

Livestock Population Worksheet

5. Enter Annual Average Population, at the lower stratum (category/subcategory/subdivision) of the Livestock Characterisation applied to the Population

☐ **Population data can be collected**

- Either through census/survey at farm
- Or from economic statistic -sell/buy- (e.g. *slaughtered animals*). Economic statistics are affected by the period within the year the individual is part of the population e.g. *broiler chickens are typically grown in flocks for 60 days, so 6 flocks can be grown within a year; accordingly slaughter statistics in a year would count 6 times the actual annual average population.*

☐ **Population may have seasonality**

- Age classes have therefore a different population size in different phases of the year; accordingly the annual average population is to be calculated e.g. *Sheep are seasonal breeders in temperate regions, meaning that they experience distinct periods of sexual activity or inactivity annually. Specifically, sheep are short day breeders, breeding at times of the year when the day length is shorter and night time longer. Consequently, lamb population has a peak in Spring (where most are slaughtered for meat consumption) and a minimum in Winter (given those are slaughtered at age of 6-8 months).*
- A population may migrate from a country to another country, and thus its annual population is averaged by the number of months X of the year (12) in which the population is present in the country [i.e. $X/12$]

Thus, the annual average population of the relevant subdivision of population is to be calculated on the basis of its average lifetime

3.A.1 (Enteric Fermentation) or 3.A.2 (Manure Management) – AD – Livestock Population

5. Enter Annual Average Population, at the lower stratum (category/subcategory/subdivision) of the Livestock Characterisation applied to the Population

Enter Typical Animal Mass/Body Weight Livestock Population Worksheet

6. Enter Typical Animal Mass/Body Weight, at the lower stratum (category/subcategory/subdivision) of the Livestock Characterisation applied to the Population

- ☐ Live-weight data should be collected for each animal category/subcategory/subdivision. It is unrealistic to perform a complete census of live-weights, so live-weight data should be obtained from representative sample studies or statistical databases if these already exist.
- ☐ Live-weight data of mature animal categories/subcategories/subdivision should refer to yearly average weight.

Select the methodological Tier to apply

Livestock Population Worksheet

7. **Select for each category, i.e. 3.A.1 and 3.A.2, the methodological Tier to apply**, at the lower stratum (category/subcategory/subdivision) of the Livestock Characterisation applied to the Population

- ☐ According to the decision tree in Figure 10.2, select the methodological Tier to be applied to estimate either 3.A.1 or 3.A.2

(Note the methodological Tier selection does not transfer from a category to the other).

- ☐ Three options are available, which selection determines whether the *Software* requires to calculate the Average Daily Feed Intake (*i.e. the daily Energy need of the population*), and which approach is to be applied to calculate it, or it does not require the Average Daily Feed Intake:

- IPCC Default, Average Daily Feed Intake calculations is not needed
- IPCC Tier 2 Simplified, the Average Daily Feed Intake is calculated directly from the Daily Dry Matter Feed Intake and the Energy Content of Feed
- IPCC Tier 2 Detailed, the Average Daily Feed Intake is calculated from the Average Daily Gross Energy need

3.A.1 (Enteric Fermentation) or 3.A.2 (Manure Management) – AD – Livestock Population

7. Select for each category, i.e. 3.A.1 and 3.A.2, the methodological Tier to apply, at the lower stratum (category/subcategory/subdivision) of the Livestock Characterisation applied to the Population

subdivision	Population heads		TAM	Method

INTERGOVERNMENTAL PANEL ON climate change

3.A – Livestock

Category	Activity	GHGs
3.A.1	Enteric Fermentation	CH ₄
3.A.2	Manure Management	CH ₄ – N ₂ O

Volume 4, Chapter 10

Activity Data – Livestock 3.A – CH₄ & N₂O

Category	Activity Data		Equation	IPCC Default
3.A.1 & 3.A.2	Any Approach	Annual Average Population (AAP)	10.1	
	Tier 1 Approach	Basic Characterisation of Population		Section 10.2.2 (para 2)
	Tier 2 Approach	Enhanced Characterisation of Population		Table 10.1
3.A.2	Any Approach	Manure Management Systems (MMS)		Table 10.18

Methodology – Livestock 3.A.1

Methodological Approach	Equation	IPCC Default
IPCC Tier 1 methodological approach	10.19 – 10.20	Table 10.11 EF for Cattle & Table 10.10 EF for Others
IPCC Tier 2 methodological approach	10.19 – 10.20	
Emission Factor (EF)	10.21	Table 10.12 Ym for Cattle/Buffalo & Table 10.13 Ym for Sheep
Daily Gross Energy Intake (GE)	As calculated from Average Daily Feed Intake	

Average Daily Feed Intake – Tier 2 – Livestock 3.A – CH₄, N₂O

Parameter			Equation	IPCC Default	
Tier 2 Approach	Average Daily Feed Intake	Detailed	Net Energy for Maintenance [NEm]	10.3 & 10.2 for Cf_{i_cold}	Table 10.4 for Cf_i – Tables 10.10 & 10A.1-9 for animal weight
			Net Energy for Activity [NEa]	10.4 (Cattle/Buffalo) – 10.5 (Sheep)	Tables 10.5 for Ca – Table 10A.1-3 for feeding situation – Table 10.10 & 10A.9 for animal weight
			Net Energy for Growth [NEg]	10.4 (Cattle/Buffalo) – 10.5 (Sheep)	Tables 10A.1-6 for animal weight & gain – Table 10.6 for constants
			Net Energy for Lactation [NEl]	10.8 (Cattle/Buffalo) – 10.9-10 (Sheep)	Tables 10A.1-3 for milk production – Fat content
			Net Energy for Work - Net energy for Wool	10.11 - 10.12	Tables 10A.1-3 for work
			Net Energy for Pregnancy [NEp]	10.13	Tables 10.7 for $C_{pregnancy}$ – Tables 10A.1-3 for pregnancy
		Ratio of Net Energy available for:	- Maintenance (REM) - Gain (REG)	10.14 10.15	Table 10.2 for Digestibility
		Daily Gross Energy Intake (GE)	10.16	Table 10.2 for Digestibility	
	simplified	Daily Dry Matter Intake (DMI)	10.17 10.18a 10.18b	Table 10.8 for dietary net energy concentration Tables 10A.1-3 for animal weight Table 10.2 for Digestibility	

Methodology – Livestock 3.A.2 – CH₄

3.A.2 - Methodological Approach	Equation	IPCC Default
IPCC Tier 1 methodological approach [CH ₄]	10.22	Table 10.14 EF for Cattle/Buffalo/Swine & Table 10.15 EF for Others
IPCC Tier 2 methodological approach [CH ₄]	10.22	
Emission Factor (EF)	10.23	Tables 10A.4-9 for B ₀ – Table 10.17 for MCF
Volatile Solid Excretion Rate (VS)	10.24	Table 10.2 for Digestibility - ASH no default
Urinary energy (UE)	UE*GE	0.02 UE for ruminants fed with ≥85% grain or swine – 0.04 UE for other ruminants
Daily Gross Energy Intake (GE)	As calculated from Average Daily Feed Intake	
Any IPCC methodological approach [Direct N ₂ O]	10.25	Table 10.21 EF

Population's Parameters – Livestock 3.A.2 – Direct N₂O

Parameter		Equation	IPCC Default
<i>Tier 1 Approach</i>	N excretion rate	10.30	Table 10.19 for Nrate - Tables 10.10 & 10A.1-9 for animal weight
<i>Tier 2 Approach</i>	N excretion rate	10.31	Table 10.20 for N retention
	N intake	10.32	Table 10.20 for N retention
	CP%	[1.9 + 0.4 * %Fat]	Tables 10A.1-3 for Fat content
	Daily Gross Energy Intake (GE)	As calculated from Average Daily Feed Intake	
	N retention	10.33	Tables 10A.1-3 for weight gain - Tables 10A.1-3 for milk production - Milk PR% no default

3.C – Aggregate Sources and Non-CO₂ emissions sources on land

Category	Activity	GHGs
3.C.6	Indirect N ₂ O emissions from Manure Management	N ₂ O

Methodology – (Livestock) 3.C.6 – Indirect N₂O

3.C.6 - Methodological Approach		Equation	IPCC Default
IPCC Tier 1 methodological approach	Volatilization	10.27	Table 11.3 EF
IPCC Tier 2 methodological approach	Leakage	10.29	Table 11.3 EF

Activity Data – (Livestock) 3.C.6 – Indirect N₂O

Activity Data		Equation	IPCC Default
Any Approach	Total N in manure	As calculated in 3.A.2	
Any Approach	Manure management systems (MMS)		Table 10.18

Population's Parameters – (Livestock) 3.C.6 – Indirect N₂O

Parameter		Equation	IPCC Default
Tier 1 Approach	N_volatilization	10.26	Table 10.22 for Frac _{GasMS}
Tier 2 Approach	N_leaching	10.28	Frac _{LeachMS} [Typical 1-20]
